It is well-known that a drop of water deposited on a superhydrophobic surface adopts a quasispherical shape to minimize its interaction with the substrate. As a result, the equilibrium contact angle,  $\theta_{eq}$ , that the drop makes with the surface can approach  $180^\circ$  (Fig. 1). Also, the literature documents the impact dynamics of fluid droplets on such surfaces.<sup>1</sup> In particular, a water droplet can bounce off of a superhydrophobic substrate.<sup>2</sup> Here, we use rotational effects to further spread out the drop during impact.

We experiment with releasing a millimeter-size drop of milk above the center of a spinning disk whose surface is covered by soot to create a superhydrophobic substrate (Fig. 1). By varying the velocity of impact  $V$  and the rotation rate  $\omega$  of the disk, we observe a rich variety of dynamics including bouncing, retracting, and dewetting.

Figure 2 shows high-speed images illustrating a typical dewetting experiment obtained for large values of both  $V$  and  $\omega$ . Upon impact, the drop deforms into a liquid sheet that spreads out until it reaches a maximum diameter [Figs. 2(a) and 2(b)]. At the same time, due to rotational effects, its thickness continually decreases [Fig. 2(c)] and upon reaching a critical value, the drop dewets via the nucleation of a dry spot at the center of the spreading liquid sheet [Fig. 2(d)]. The hole in the sheet then grows to the ejection of the drop from the substrate [Figs. 2(e) and 2(f)]. We rationalize these results using simple physical arguments comparing the surface tension effects with rotation-driven spreading and thinning. For lower values of  $V$  and  $\omega$ , the drop bounces while for intermediate speeds the drop spreads on the substrate, retracts, and then breaks up into smaller droplets (Fig. 3). In conclusion, by varying the values of  $V$  and  $\omega$ , we obtain a variety of new dynamical behaviors for drop impact on superhydrophobic substrates, from a simple bounce to “spiders” and “black holes” [Figs. 3(a)–3(c)].
